ZECATHON HACKATHON · TURNING FINANCIAL DATA INTO ACTIONABLE INSIGHTS

Ajora

Your true cashflow.

One honest view across every bank and wallet, and the invisible economy no other app can see.

A secure, consent-first multi-bank financial insights platform

THE PROBLEM

Nobody has a view of their money they can actually trust

The numbers are wrong

Moving ₦200k from your GTBank to your Zenith account is logged as **+₦200k income and ₦200k spending**. Every aggregator double-counts, overstating both by 30–40%.

The real story is invisible

Thrift groups (ajo/esusu), family support, remittances and informal loans, how Nigerians truly move money, are unlabelled noise to every tool built abroad.

THE HIDDEN COST

38%

of what a typical multi-bank app calls your **"income"** can just be you moving money between your own accounts. The view you're trusting is a fiction, and you budget against it.

THE SOLUTION

One secure view that is finally accurate, then finally meaningful

01: Subtract the noise

The dedup engine

Detects money you move **to yourself** across banks and removes it, producing cashflow that is arithmetically correct for the first time.

02: Reveal the story

Communal insight

What's left is the real economy: thrift groups, dependents, remittances and loans, classified into commitments your bank can't see.

THE ENGINE

Four stages turn double-counted chaos into truth

1

Candidate match

Pair each outflow with inflows in your other accounts by amount and time window.

2

Smart scoring

Weigh amount (with fees and FX), timing, name and narration, plus your own patterns.

3

Optimal pairing

The Hungarian algorithm matches each transfer exactly once, globally, never greedily.

4

Confidence tiers

Auto-collapse the certain; ask you about the rest, and every answer trains the model.

Result: accurate income and spending, with a measurable precision/recall score we report on labelled data.

THE STORY, OUR EDGE

Nigeria’s invisible economy, finally made visible

Thrift groups · Ajo / Esusu

"₦50k every month to your group, next payout around March, you're 3rd of 8 in the rotation."

Dependents · ”Black tax”

"₦80k a month supports 2 family members, that's 18% of your take-home income."

Informal lending

"You lent Tunde ₦120k; ₦40k has come back. Net, he still owes you ₦80k."

Remittances

"₦X sent abroad each month, detected and tracked automatically, never guessed."

THE INNOVATION

Two halves no competitor has together

Accuracy nobody else has

Cross-institution transfer dedup is unsolved in shipping products. Our numbers are right where every competitor's are inflated.

Insight nobody else has

Communal patterns only emerge after dedup, so we are the only ones who can surface them. The moat is the sequence.

Built for Nigeria, not ported to it

Ajo, black tax, remittances and informal lending are native concepts here, not an afterthought bolted onto a Mint clone.

TARGET USERS

For everyone whose money lives in more than one place

Multi-bank earners

The salaried professional juggling 2–4 banks and wallets with no single source of truth.

Gig & SME owners

Freelancers and small businesses with irregular income and blurred personal-business flows.

The communally committed

Anyone supporting family, saving in a thrift group, or lending within their circle.

THE IMPACT

From confusion to control, and inclusion

Honest budgeting

Customers see their real discretionary income once the phantom 30–40% is stripped away.

Financial inclusion

Clean, consolidated cashflow can underwrite credit for thin-file and self-employed users.

Deeper trust

Insights a single bank simply cannot offer, a reason for customers to stay and engage.

TECHNOLOGY

A secure, modern, AI-driven stack

Data aggregation

Open-banking APIs (Mono, Okra, Stitch) + schema-matched mock layer

AI / ML & analytics

Dedup classifier, Hungarian matching, RapidFuzz, NetworkX graphs

GenAI

LLM assistant that explains insights in plain language, grounded on your data

Application

Python + FastAPI backend; React / Next.js, Recharts and Cytoscape.js front end

Cloud

Containerised with Docker, deployed on scalable cloud infrastructure

Security

OAuth consent, encryption at rest & in transit, revocable tokens, audit log

IMPLEMENTATION APPROACH

Six phases, engine-first

Phase 1

Secure data layer

Consent flow + ingestion against open-banking APIs and a labelled mock dataset.

Phase 2

Normalization

Unify multi-bank schemas, currencies and categories into one model.

Phase 3

Dedup engine

The core: match, score, pair, tier, and report accuracy metrics.

Phase 4

Insight engine

Relationship graph + communal-finance classifiers, with a GenAI explainer.

Phase 5

Experience & security

Dashboard with dedup toggle + graph view; consent, revocation, audit screens.

Phase 6

Deploy & demo

Containerised cloud deployment, demoed on the labelled persona dataset.

SECURITY & TRUST

Consent-first, and private by design

Customer-permitted only

Access is granted per account through open banking, and revocable at any time.

Encrypted end to end

Data is encrypted in transit and at rest, with scoped, short-lived tokens.

Data minimization

We pull only the fields an insight needs, nothing is collected "just in case".

Auditable, never sold

An append-only audit log records every access; customer data is never sold.

AJORA · YOUR TRUE CASHFLOW

First we make your money honest. Then we make it make sense.

Accurate cross-bank cashflow, plus the communal insights no one else can see, securely, and with the customer in control.
